REQUESTED MODEL EVIDENCE

Multi-data cataract grade model

Requested slit-lamp grade model using imaging and patient variables

STATUS: NOT TRAINED	Accuracy, sensitivity, specificity and AUC are not available. This is an evidence-readiness report, not a performance report.

Readiness graph

Evidence gate	Coverage	Decision
Slit-lamp files technically inventoried		100% · available
Populated image-level grade labels		0% · blocked
Verified image-to-clinical crosswalk		0% · blocked
Patient-level split		0% · blocked
External validation cohort		0% · blocked

The bars measure prerequisite coverage only; they are not model accuracy.

Why training is blocked

- The 1,380-row clinician label sheet has zero populated cataract/LOCS fields.
- The separate grading workbook has useful tabular labels but no image filename/path key.
- Overlapping numeric IDs cannot be assumed to identify the same people or eyes.

Minimum evidence needed to unlock training

A de-identified crosswalk with image path/ID, subject ID, laterality, visit, adjudicated grade/LOCS fields and provenance; freeze subject-level splits before preprocessing.

SAFETY DECISION	No checkpoint was created and no clinical claim is made. Training against guessed image-to-record links would create invalid evidence.
