REQUESTED MODEL EVIDENCE

Clinical fusion CNN model

Requested CNN imaging encoder fused with structured clinical features

STATUS: NOT TRAINED	Accuracy, sensitivity, specificity and AUC are not available. This is an evidence-readiness report, not a performance report.

Readiness graph

Evidence gate	Coverage	Decision
Clinical workbooks inventoried		100% · available
Paired image + clinical rows		0% · blocked
Adjudicated fusion outcome		0% · blocked
Patient-level split		0% · blocked
External validation cohort		0% · blocked

The bars measure prerequisite coverage only; they are not model accuracy.

Why training is blocked

- The workbooks represent several cohorts with no verified image-record crosswalk.
- No prospectively defined fusion target or clinical outcome was identified.
- Without patient identity boundaries, train/test leakage cannot be excluded.

Minimum evidence needed to unlock training

A governed paired dataset with image, structured features, explicit target/outcome, subject key, laterality and visit timing, plus an untouched external cohort and documented missing-data policy.

SAFETY DECISION	No checkpoint was created and no clinical claim is made. Training against guessed image-to-record links would create invalid evidence.
